## Enamine Molucelar Glue Set

4500 cpds, designed to capture the widest possible range of novel chemotypes of CRBN binders, Molecular Glues can induce proximity between a target protein and an E3 ubiquitin ligase, resulting in selective degradation of the target protein. The potential of targeted protein degradation, opening new avenues in drug discovery—particularly for proteins previously considered “undruggable.” this library is designed to engage multiple E3 ligases.
